PR KADECO: EASY INSTALLATION - INSTALLATION CASSETTE

KADECO's installation cassette offers a particularly practical and easy-to-install glare protection solution. It is especially suitable for the object area, due to its modular principle, simple installation and inconspicuous appearance.

While the installation profile has already been mounted into the ceiling during the shell construction, the roller blind type, the fabric and any desired cladding can be selected much later and installed easily. This provides flexibility in the planning process without making the subsequent installation of the roller blinds, a challenge. In addition to a recess option, a flush, partial face fit as well as a full face fit, are available. Thanks to the powder-coated surface in a fine matt white finish, all versions integrate almost invisibly into the ceiling.

The recessed cassette system is suitable for acoustic and hard plasterboard ceilings as well as for solid concrete ceilings. The basic mounting profile can be mounted on the wall or ceiling and is compatible with all suspension systems for ceiling mounting commonly available on the market.

The roller blinds can be operated either manually via a chain pull drive or via motorisation. The motorised solution can easily be integrated into an existing building control system.

Needless to say, in addition to the recessed cassette system, we also offer a wide range of flame-retardant fabrics in various degrees of transmission in, for example, the same colours, that optimally meet the requirements of the workplace ordinance for glare protection.
